

Magnetic Quantum Transitions in Insulators and Superconductors

Subir Sachdev

Physics Department, Yale University, New Haven, CT 06520-8120

Abstract

I will review the theory of magnetic quantum phase transitions in insulators and superconductors. The emphasis will be on the influence of temperature and applied magnetic field, and the implications for neutron scattering experiments. I will use the theory to interpret recent experiments on spin gap compounds and cuprate superconductors in a magnetic field.
